Sierra Snows: WY2023 was a big snow year out West

Snow Water Equivalent at Poison Flat

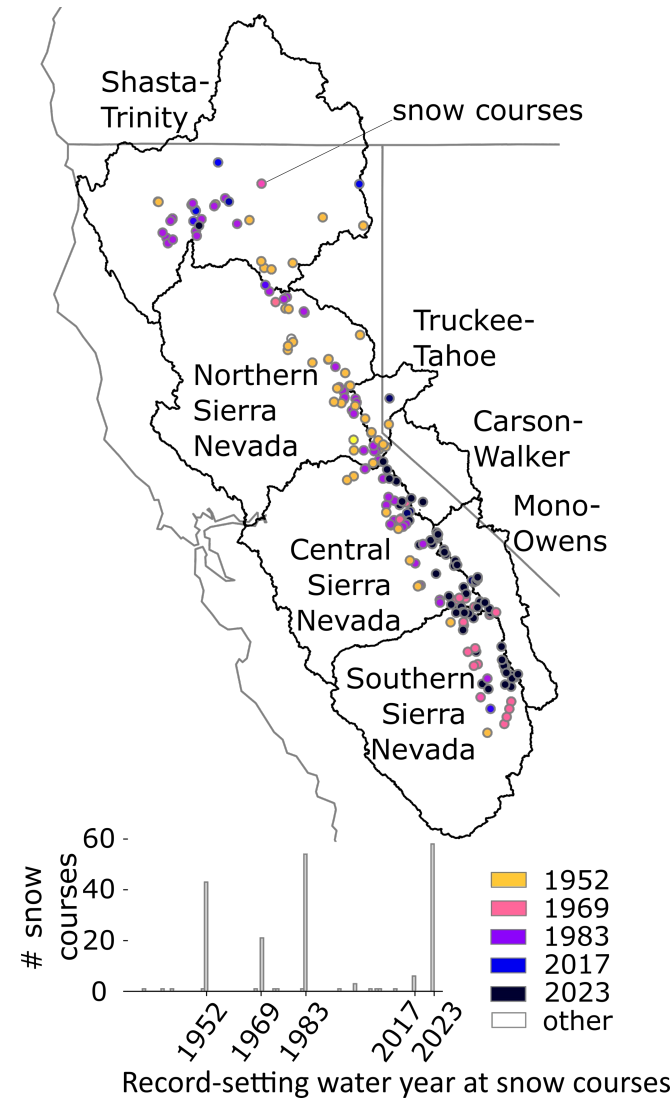

Source: USDA NRCS National Water & Climate Center

Sierra Snows: WY2023 was a big snow year out West

Summary of snowfall:

- Ranked peak SWE from snow courses (~200) from 1930's through 2023
- Big years: 1952, 1969, **1983**, 2017 and 2023
- Northern, central and southern shifts observed
- WY2023 was particularly "large" in the southern and central Sierra Nevada

Upper Colorado Snows: WY2023 was a big snow year out West

WY2023 SWE in San Juan Basin (16 SNOTEL Sites)

Peak in WY 2023:

- 30.8 inches SWE
- 152% of normal SWE peak in San Juan

(normal SWE peak: annual median SWE peak during WY 1991-2022, 20.3 in.)

The Min., Max., median, 25th and 75th percentile of SWE are based on the data during WY1991–WY2022.

Upper Colorado Snows: WY2023 was a big snow year out West

WY2023 SWE in San Juan Basin (16 SNOTEL Sites)

Peak in WY 2023:

- 30.8 inches SWE
- 152% of normal SWE peak in San Juan

(normal SWE peak: annual median SWE peak during WY 1991-2022, 20.3 in.)

12 Extreme Snow Days (SWE ≥ 1 in/day):

- 14.1 inches SWE
- 70% of normal SWE peak
- 46% of WY2023 SWE peak

Upper Colorado Snows: Contribution of ARs

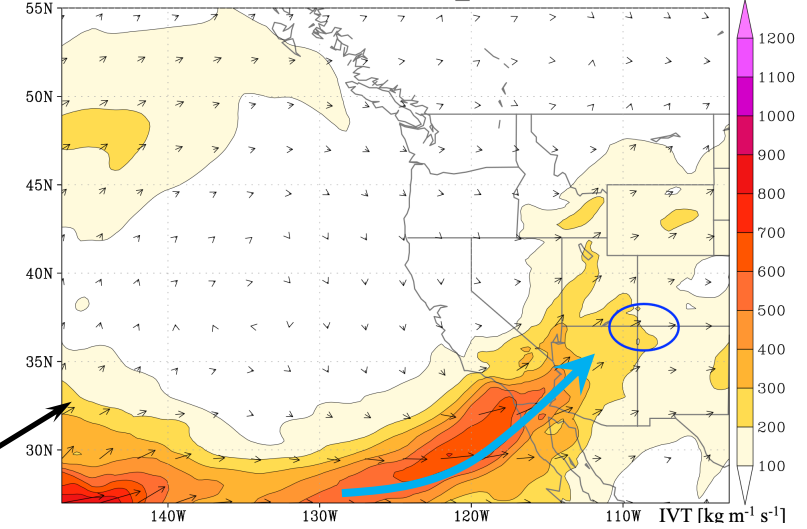

IVT 20230101_00Z

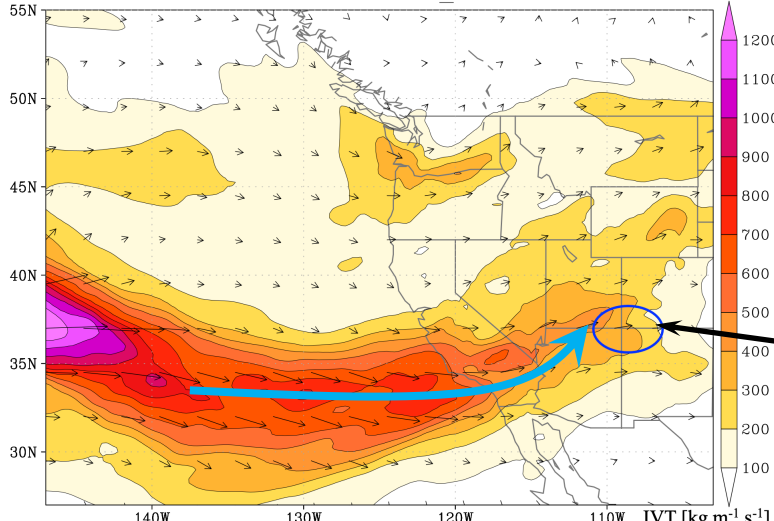

Landfalling ARs over the Southern–Baja California penetrating into the Southwest U.S.

ARs: Late December into Early January Featured several landfalling ARs

U.S. Selected Significant Climate Anomalies and Events for January 2023

Jan was warmer than average for the state of AK. Anchorage was 7°F above normal – its warmest Jan since 2006.

On Jan 31, about 42.7% of the contiguous U.S. was in drought, down about 3.6% from the beginning of Jan. Drought conditions expanded or intensified across portions of the southern Plains, the FL Peninsula and parts of the Rockies, Pacific Northwest, Midwest and HI. Drought contracted or was eliminated across large parts of the West and Midwest, and portions of the Plains, Southeast, Northeast and PR.

From Dec 26 to Jan 17, a series of nine atmospheric river events caused significant flooding, power outages and mudslides in CA that resulted in at least 21 deaths, 1,400 rescues and 700 landslides.

On Jan 16, two tornadoes were confirmed by the National Weather Service in IA – the state's first Jan tornadoes in more than 50 years.

A tornado outbreak occurred in IL with nine confirmed tornadoes on Jan 3 – the highest number of tornadoes in Jan, for the state, since 1989.

Much of the Northeast saw record warmth in Jan. ME, CT, MA, NH, NJ, RI and VT had their warmest Jan on record.

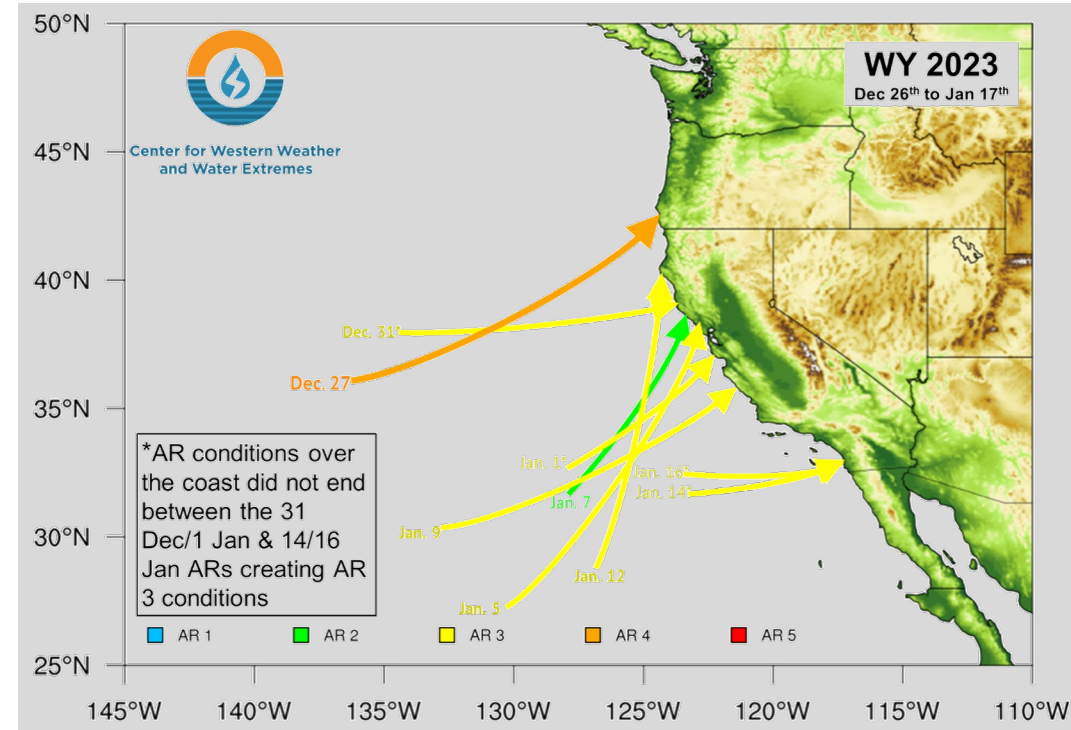

NYC remained snowless through the end of Jan, setting a new latest first measurable snowfall record that was previously set on Jan 29, 1973.

During late Jan, a strong low pressure system brought flooding, landslides and wind-toppled trees to portions of HI. Islands of Maui and Molokai reported 20-31 in. of rainfall over a five-day period.

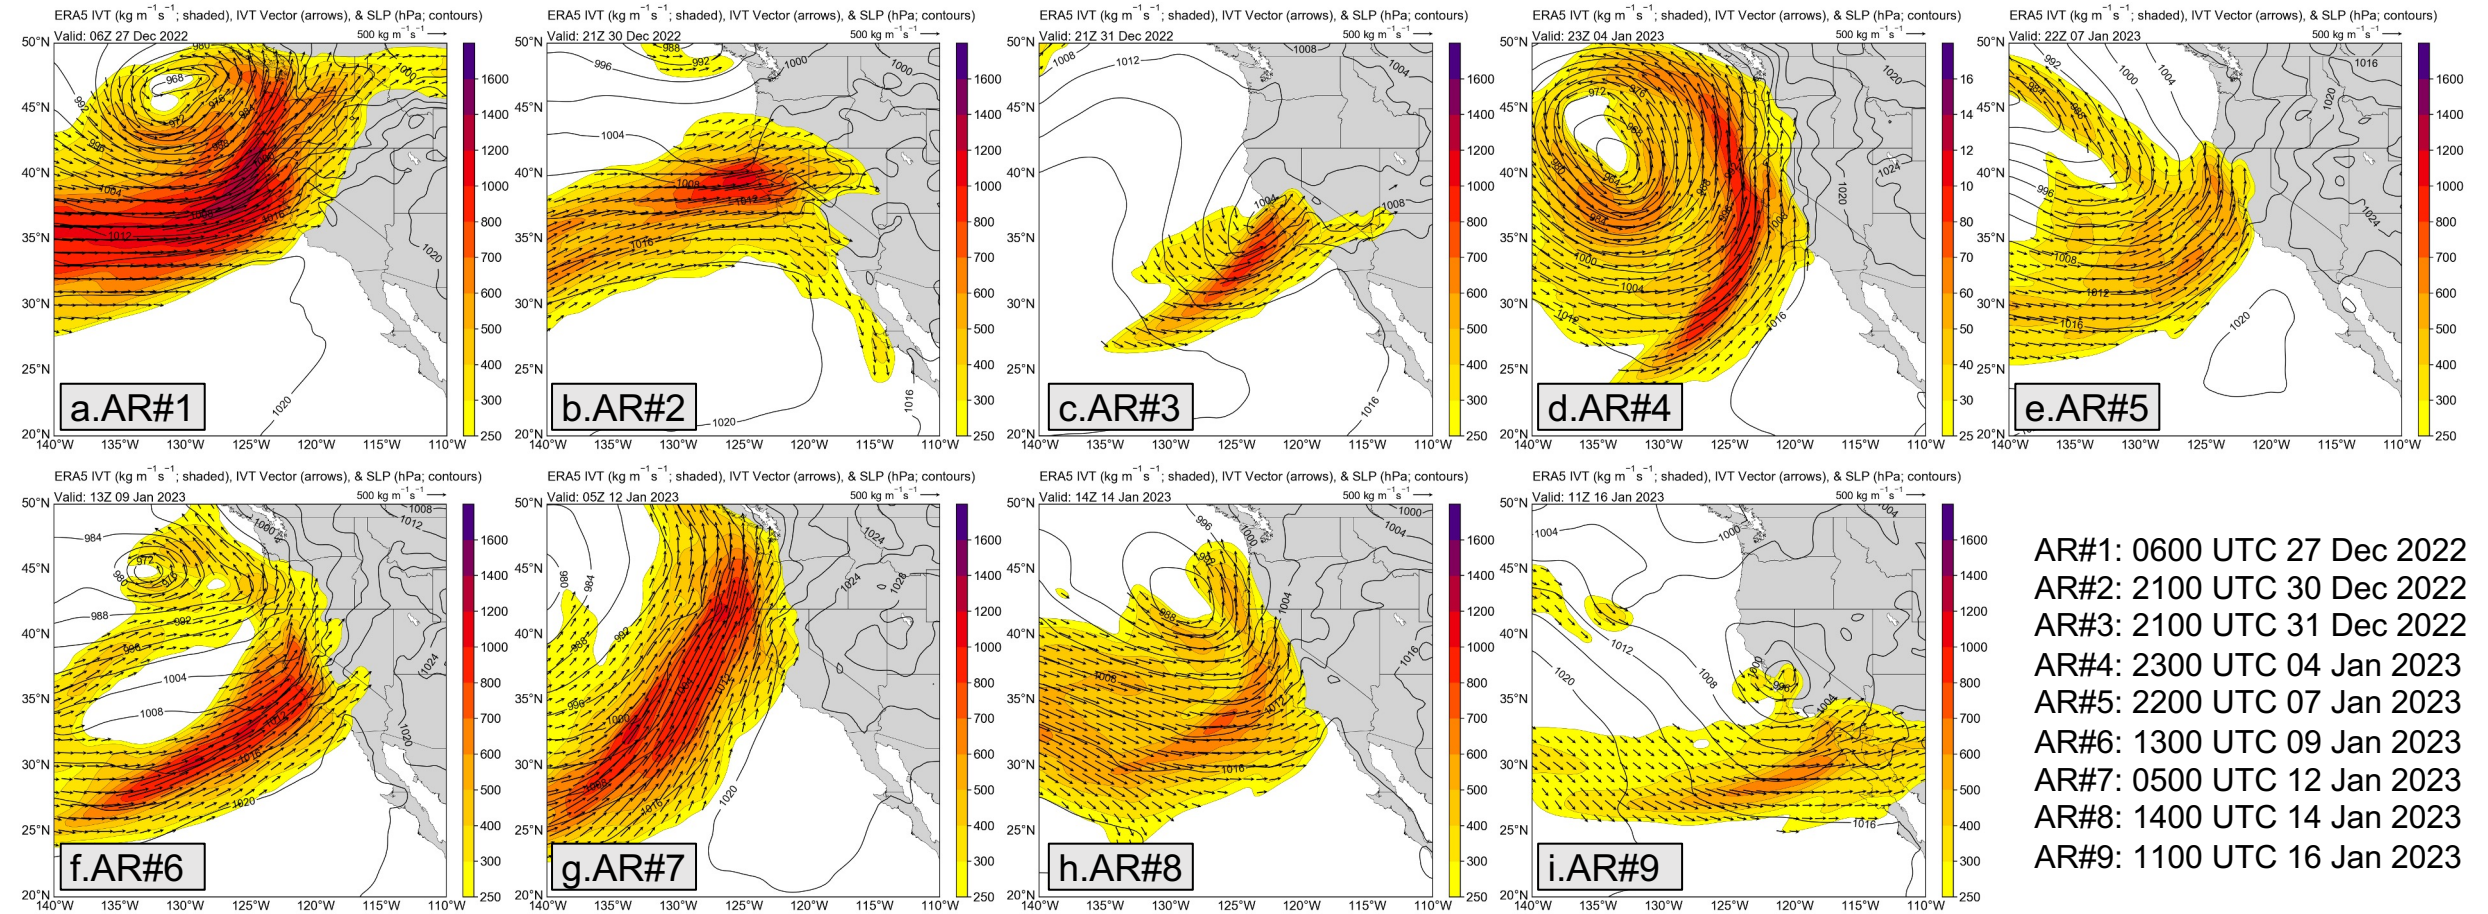

About 50 million people were under winter weather alerts in late Jan as a slow-moving storm brought freezing rain and accumulating ice to parts of the southern Plains.

The average U.S. temperature for Jan was 35.2°F, 5.1°F above average, ranking sixth warmest in the 129-year record. The U.S. precipitation average for Jan was 2.85 in., 0.54 in. above average, ranking in the wettest third of the record.

Please Note: Material provided in this map was compiled from NOAA's State of the Climate Reports. For more information please visit: <https://www.ncei.noaa.gov/access/monitoring/monthly-report/>

Storm Snapshots: Nine ARs at their time of maximum coastal IVT magnitude

- AR#1: 0600 UTC 27 Dec 2022
- AR#2: 2100 UTC 30 Dec 2022
- AR#3: 2100 UTC 31 Dec 2022
- AR#4: 2300 UTC 04 Jan 2023
- AR#5: 2200 UTC 07 Jan 2023
- AR#6: 1300 UTC 09 Jan 2023
- AR#7: 0500 UTC 12 Jan 2023
- AR#8: 1400 UTC 14 Jan 2023
- AR#9: 1100 UTC 16 Jan 2023

Integrated water vapor transport (IVT) magnitude (kg/ms ; shaded according to scale) and direction (vectors according to reference; top right) with sea-level pressure (hPa; contours) at time of maximum IVT magnitude over coastal California for each of nine landfalling ARs on 27 December 2022 through 16 January 2023. Data source is ECMWF ERA5.

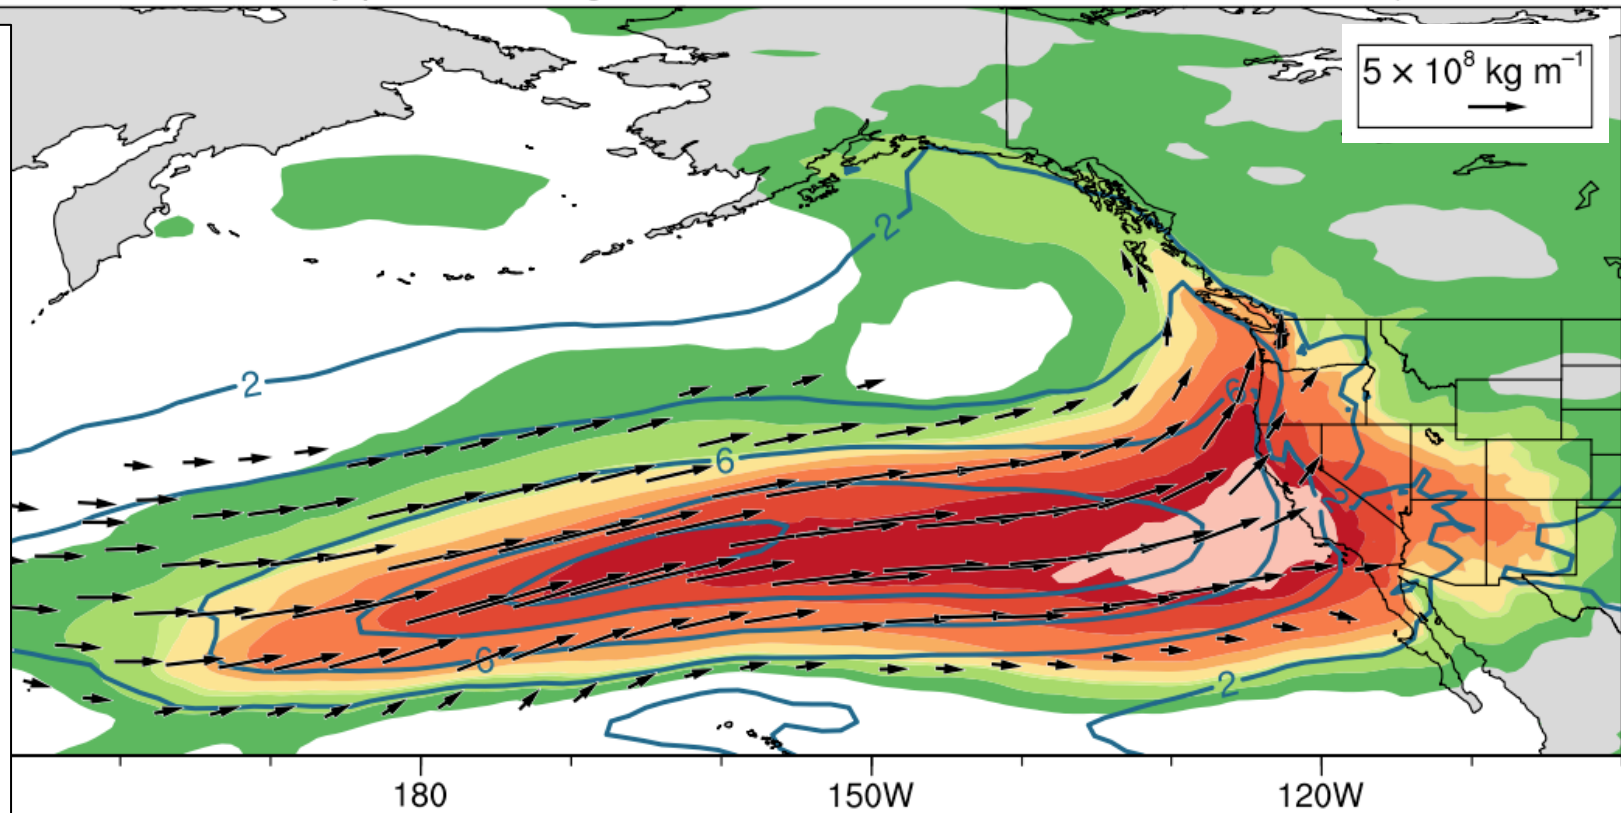

Climatological Perspective: Time-Integrated IVT

Rank of time-integrated IVT for 21-day period ending 0000 UTC 16 Jan 2023

ERA5, 1959–2022

Percentile rank (shading) of 21-day time-integrated IVT ending at 0000 UTC 16 January 2023 from ECMWF ERA5 reanalysis with respect to distribution for all 21-day periods between 1 January 1959 and 30 November 2022. The time-integrated IVT for the 21-day period (vectors plotted for magnitudes $>2.5 \times 10^8 \text{ kg m}^{-1}$; magnitude contoured every $2 \times 10^8 \text{ kg m}^{-1}$) is overlaid.

AR Recon: What is it?

Atmospheric River Reconnaissance

AR Recon: Targeting ARs, Essential Structures, and Sensitivity

How do we determine where to fly and where to drop?

Fundamental physics knowledge, Adjoint model sensitivity (NRL), Ensemble sensitivity (U Albany, NCEP)

Wilson, A. M., Cobb, A., Ralph, F. M., Tallapragada, V., Davis, C., Doyle, J., Delle Monache, L., Pappenberger, F., Reynolds, C., Subramanian, A., Cannon, F., Cordeira, J., Haase, J., Hecht, C., Lavers, D., Rutz, J. J., & Zheng, M. (2022). Atmospheric River Reconnaissance Workshop Promotes Research and Operations Partnership, *Bulletin of the American Meteorological Society*, **103**, E810-E816. <https://doi.org/10.1175/BAMS-D-21-0259.1>

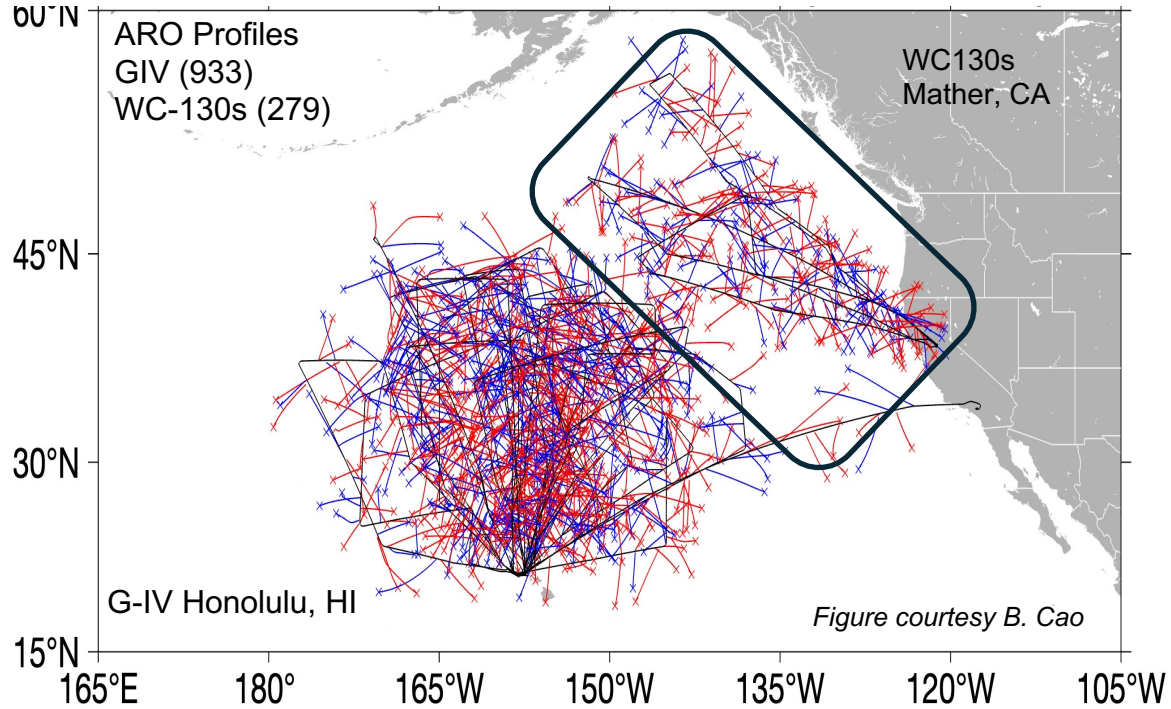

AR Recon Leads:

- F. Martin Ralph (UCSD/SIO/CW3E) – PI
- Vijay Tallapragada (NWS/NCEP) - Co-PI

AR Recon: Collaborations and Partnerships

- Drifters: NOAA-funded Global Drifter Program at Scripps' Lagrangian Drifter Laboratory (PI, Dr L Centurioni). Up to 64 drifters deployed each year – goal to ramp up to 128
- Airborne Radio Occultation (PI, Dr J Haase, Scripps). WY2024 – equipment on NOAA and 2 Air Force aircraft, ramping up to 2 NOAA and 10 Air Force aircraft.

AR Recon Leads:

- F. Martin Ralph (UCSD/SIO/CW3E) – PI
- Vijay Tallapragada (NWS/NCEP) - Co-PI

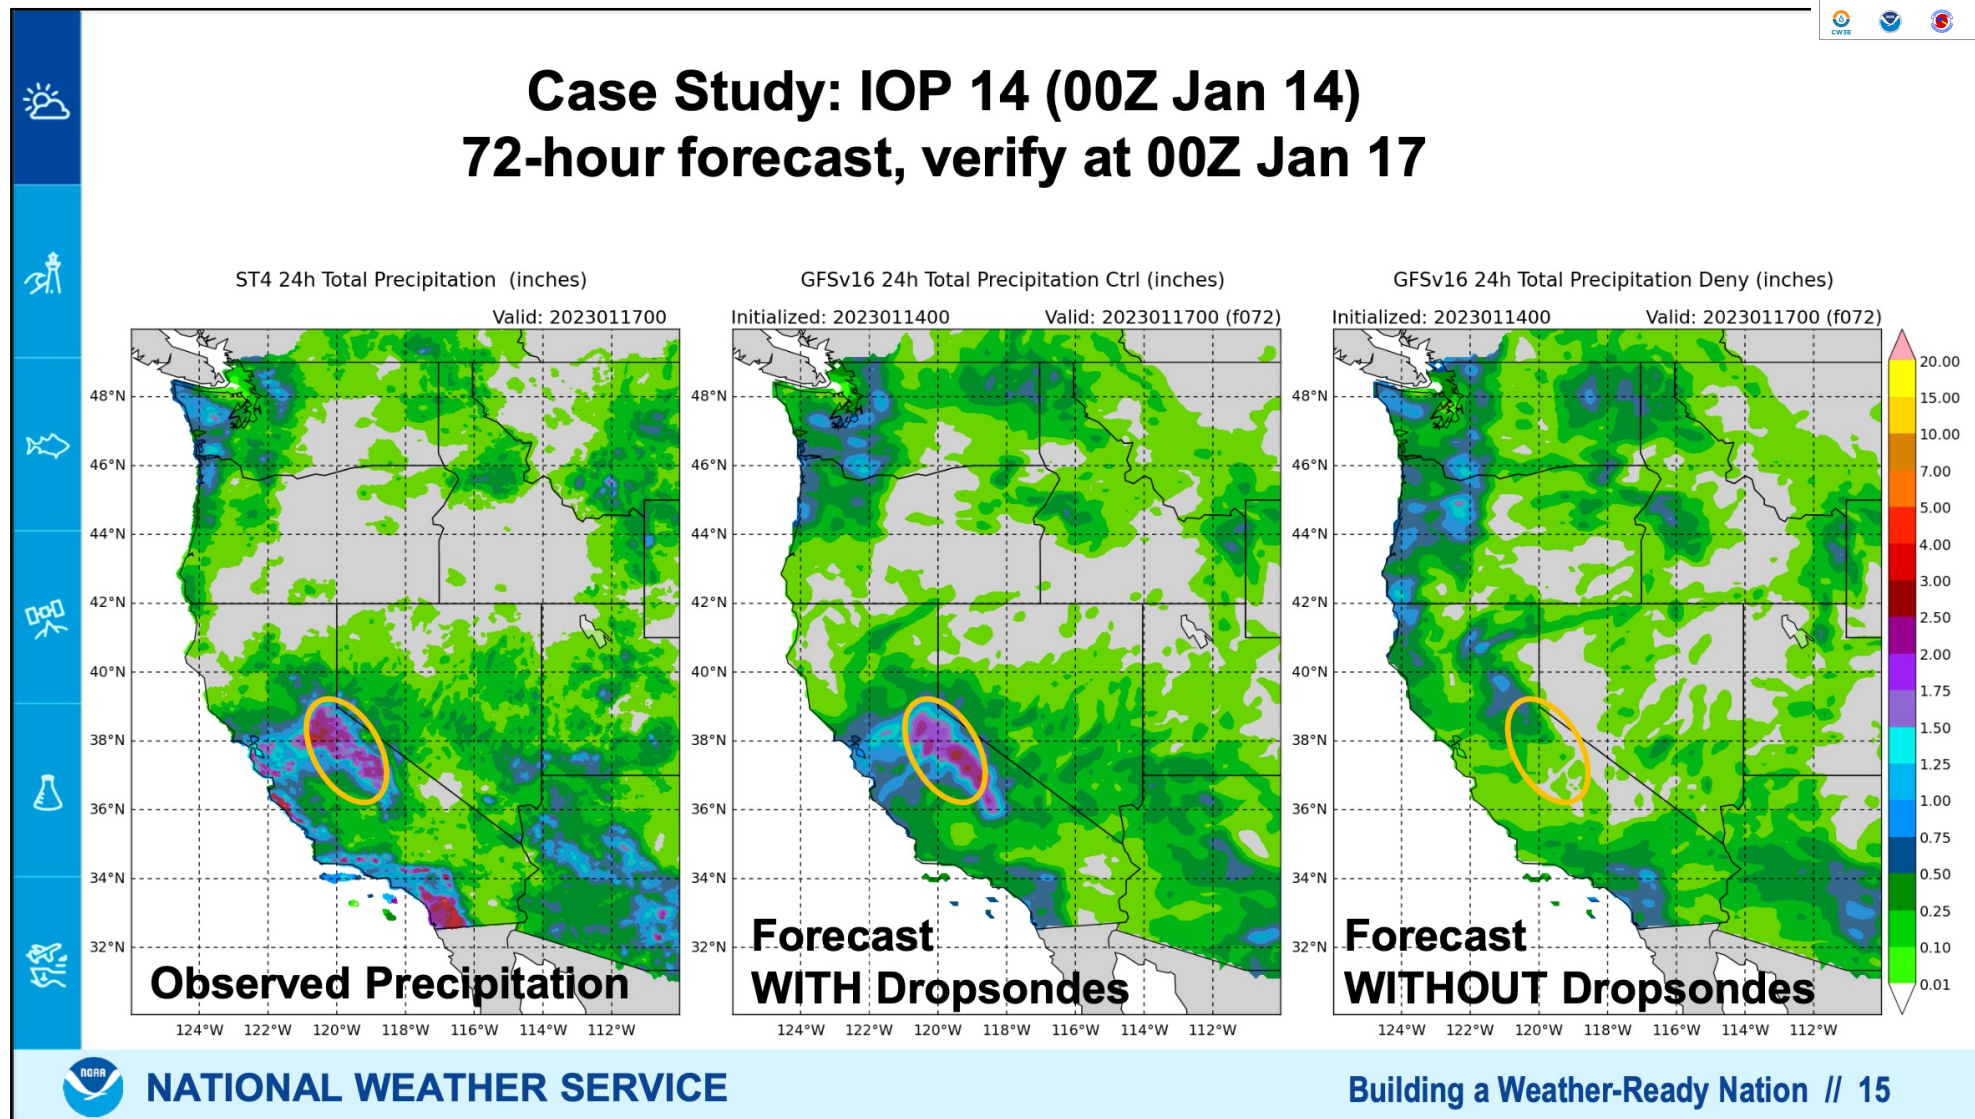

AR Recon: Better observations → Improved Forecast Skill (WY23)

Case Study: IOP 14 (00Z Jan 14) 72-hour forecast, verify at 00Z Jan 17

AR Recon: Better observations → Improved Forecast Skill

Stage IV Observed

Precipitation Error Difference

DeHaan, L., A.M. Wilson, B. Kawzenuk, M. Zheng, L. Delle Monache, X. Wu, D.A. Lavers, B. Ingleby, V. Tallapragada, F. Pappenberger, and F.M. Ralph, 2023: Impacts of Dropsonde Observations on Forecasts of Atmospheric Rivers and Associated Precipitation in the NCEP GFS and ECMWF IFS Models. *Wea. Forecast.*, **38**, 2397-2413.

AR Recon Leads:

- F. Martin Ralph (UCSD/SIO/CW3E) – PI
- Vijay Tallapragada (NWS/NCEP) - Co-PI

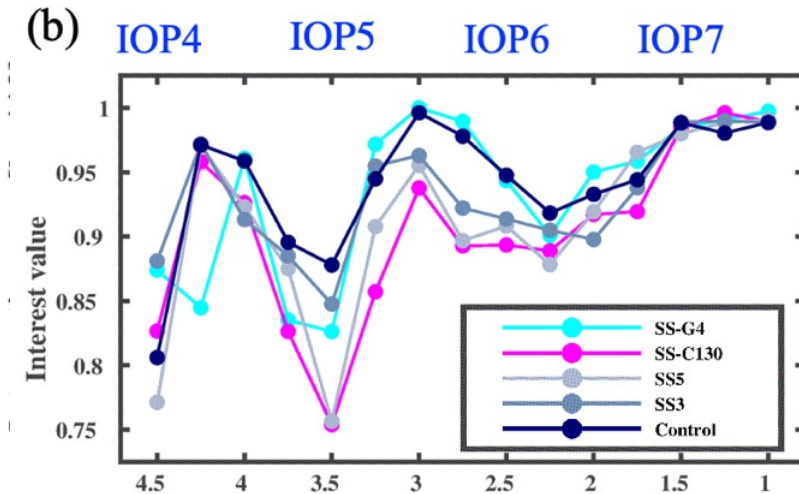

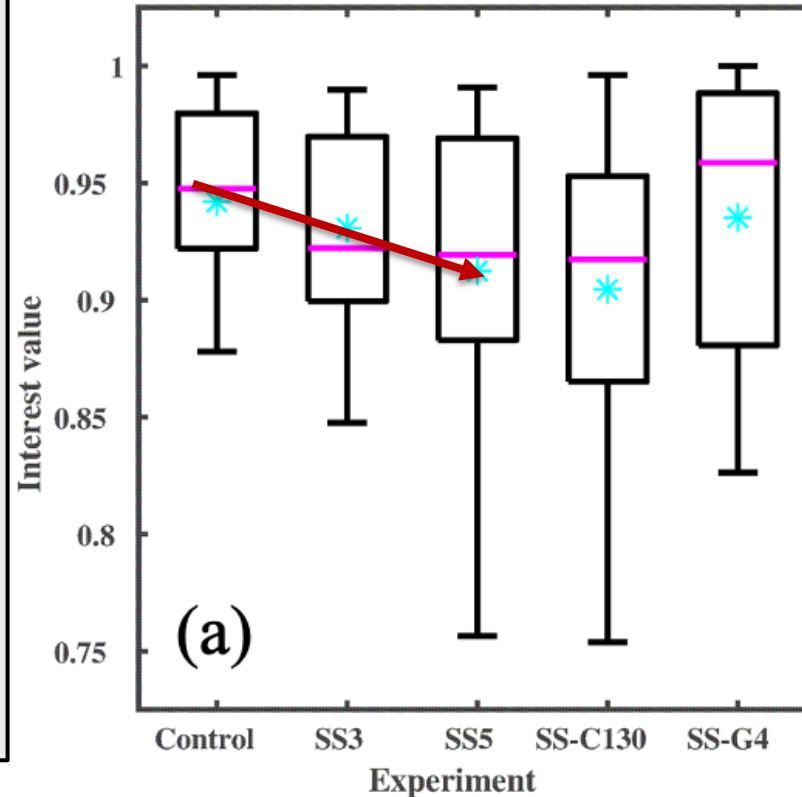

AR Recon: Better observations → Improved Forecast Skill

Major findings:

1. Dropsondes improve the representation of ARs in the model analyses, especially near sharp gradients.
2. Reduced mission frequency and reduced dropsonde horizontal spacing both degrade forecast skill.
3. The inclusion of two types of aircraft (G-IV & C-130s), sampling different regions, is an effective strategy to enable the benefits of consecutive missions.

Impact of spatial sampling & aircraft

Zheng, M., R. Torn, L. Delle Monache, J. Doyle, F.M. Ralph, V.S. Tallapragada, C. Davis, D. Steinhoff, X. Wu, A. Wilson, et al. 2024: An Assessment of Dropsonde Sampling Strategies for Atmospheric River Reconnaissance. *Mon. Wea. Rev.*, in press.

- F. Martin Ralph (UCSD/SIO/CW3E) – PI
- Vijay Tallapragada (NWS/NCEP) - Co-PI

CW3E In-situ Observations: Research and Operations

- USACE-funded FIRO enables CW3E to conduct storm sampling campaigns using **radiosondes** from 4 (of 5) locations in CA simultaneously during storms, at least every 3 hours throughout landfalling ARs
- New locations in Washington, with USACE and Tacoma Water, planned for 2023-24
- **Improved understanding of landfalling AR, increased obs for model assim., verification, & improvement**

- F. Martin Ralph (UCSD/SIO/CW3E) – PI
- Vijay Tallapragada (NWS/NCEP) - Co-PI

AR Recon: Quick Look at Water Year 2024

AR Recon 2024 Dropsonde Locations

IOPs 1-34 (15 Nov - 15 Feb)

Expansion to Guam:
drifter deployment;
aircraft missions

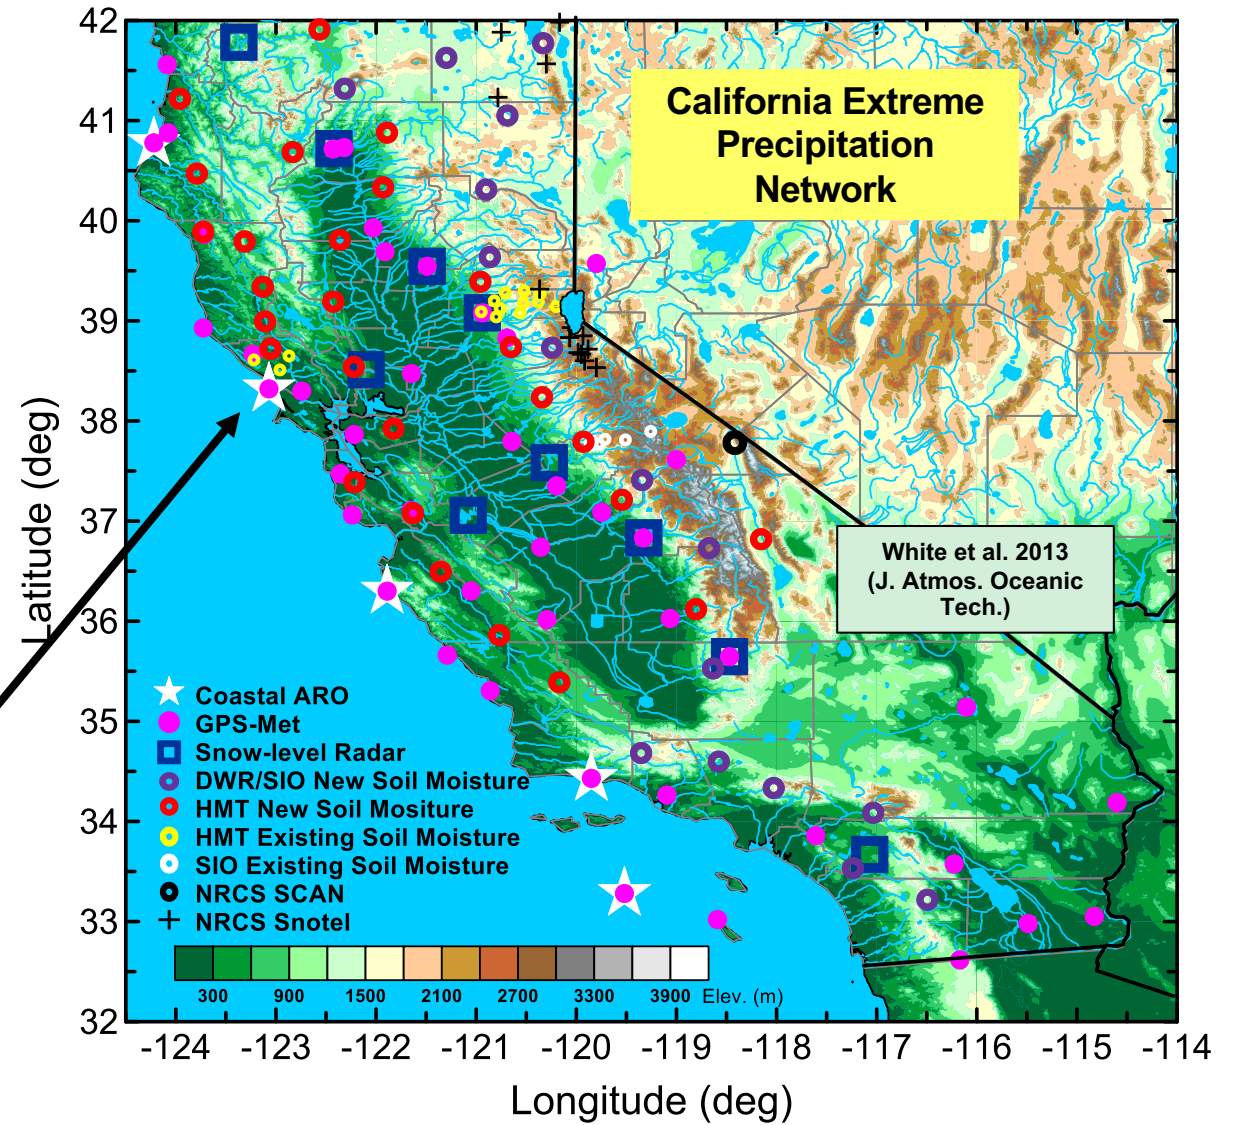

Tacoma radiosonde
site added

**Dropsondes to date
(29 Feb 2024):
1475 profiles
40 IOPs**

CW3E In-situ Observations: Building on a Foundational Network

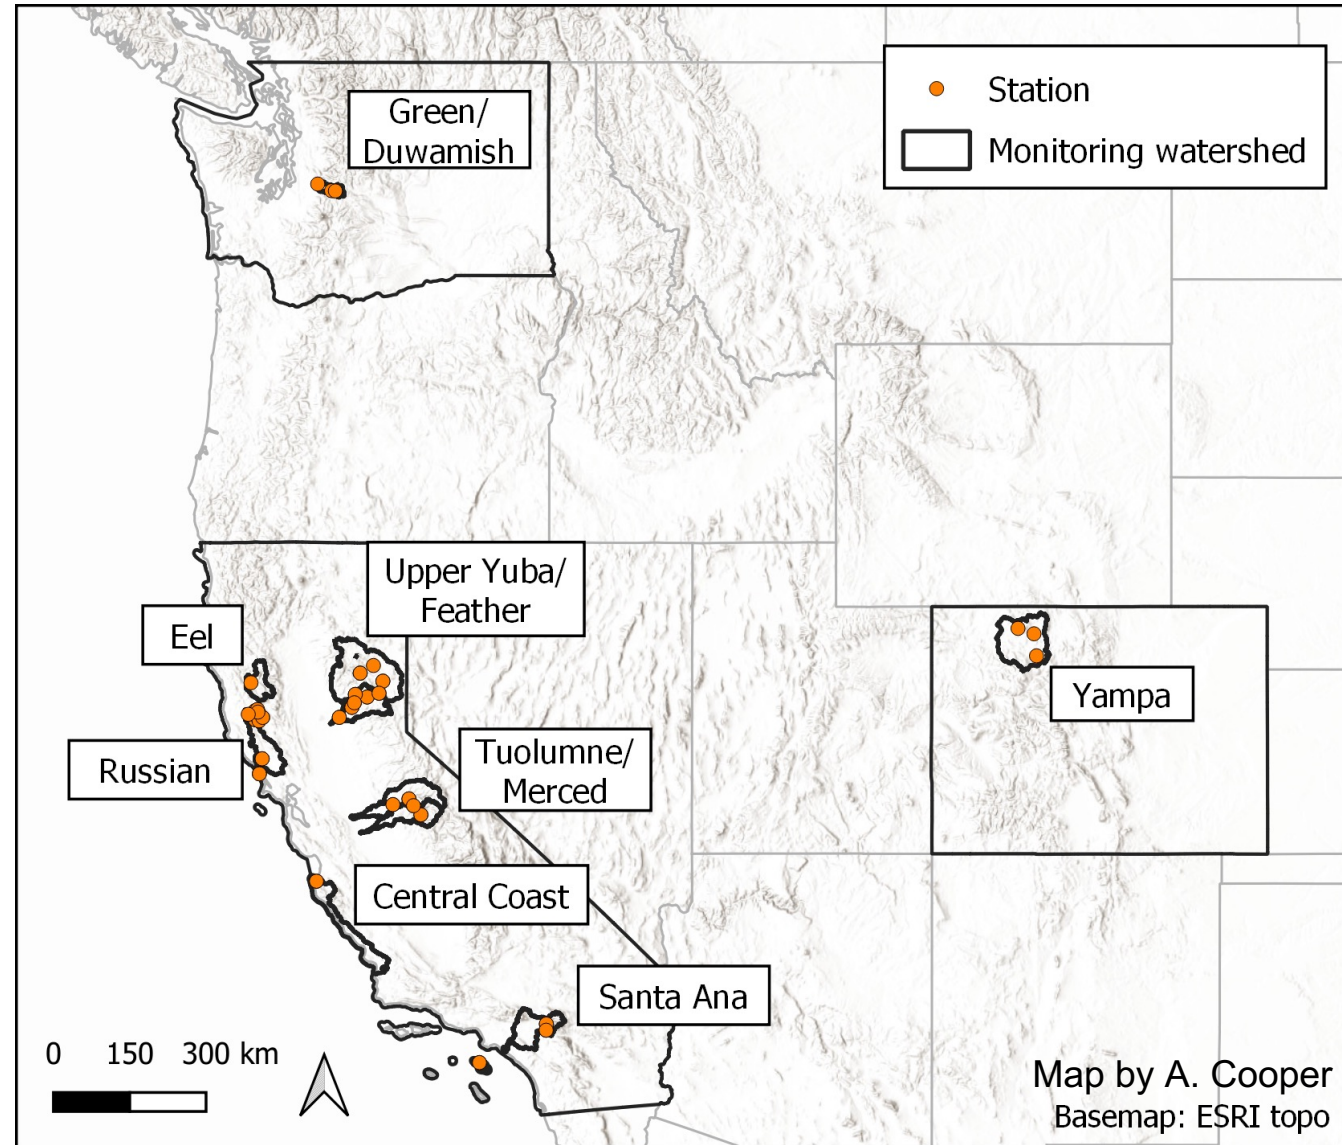

Atmospheric River Observatories ~250km apart: all impactful ARs hitting the west coast will be sampled with this “picket fence” approach

Vertically pointing radars throughout the Sierra foothills – will watersheds receive snow or rain?

CW3E In-situ Observations: Network Enhancements

- Leveraging CA's foundational statewide "storm-scale" observation network (e.g., AR Observatories, Sierra foothills vertically pointing radars)
- CW3E operates >70 sites in 10 watersheds in CA, WA, CO
- Observations: stream sampling, soil moisture, vertically pointing radars, & wind profilers/radiosondes
- Used for model verification, awareness of antecedent watershed conditions, and improvement of process-based understanding
